

ABSTRACT OF THE DISCLOSURE

A system and method that secures select data in a mobile computing device and retrieves the select data at a remote server. An application is installed on the mobile computing device which sends a periodic signal to the remote server and receives an acknowledgement signal from the remote server indicating if the mobile device is stolen. If the mobile computing device is separated from its rightful owner, the owner may request the remote server to secure and retrieve select data from the mobile computing device. Upon receipt of the mobile device signal, the remote server sends a retrieval request to the mobile computing device. After receiving the retrieval request, the mobile computing device secures the select data, sends the secured data to the remote server, and then deletes the select data from the mobile computing device.
